Stop Taking Harsh Drugs for Constipation

Avoid Intestinal Upset! Get Relief This Gentle Vegetable Laxative Way!

For constipation, never take harsh drugs. They cause bowel cramps and griping, disrupt normal bowel action, make repeated doses seem needed.

When you are temporarily constipated, get sure but gentle relief—without griping, without harsh drugs. Take Dr. Caldwell's Senna Laxative compound in Syrup Pepsin. The extract of Senna in Dr. Caldwell's is one of the finest natural laxatives known to medicine.

Dr. Caldwell's Senna Laxative tastes good, gives gentle, comfortable, satisfying relief of temporary constipation so you can be member of the family. Helps you get "on schedule" without repeated doses. Even relieves stomach nausea that constipation often brings.

Buy Dr. Caldwell's. Money back if not satisfied. Mail bottle to Box 206, New York 14, N. Y.

IT MEANS SO MUCH TO KEEP IN TOUCH

Cassidy

By Mrs. T. H. Vice

Rev. and Mrs. J. M. Bevins and Mr. and Mrs. O. L. Hollar spent Sunday with Mr. and Mrs. Marshall Walton.

Mr. and Mrs. Earl Letcher and Faye visited Mrs. Park Crump Friday afternoon. Mrs. Crum, remains ill at her home.

Miss Dottie Bretz, member of the N. C. H. Senior class, enjoyed the trip to Washington and N. Y.

Mrs. Ed Crawford who has spent several weeks in Paris with her sister is visiting relatives here.

Mr. and Mrs. Eugene Letcher and Phyllis Jean, Mr. and Mrs. Earl Letcher, Faye, Clay and Ronnie spent Sunday afternoon with Mr. and Mrs. T. H. Vice and family.

Don't forget the Revival starting May 18 thru May 30. Services each night at 7:30 by the Rev. G. C. Gunnce. You are invited to attend.

Mrs. T. H. Vice was in Maysville at Central Methodist church Thursday to attend W. S. C. S. District Meeting, where memorial services for Mrs. A. C. Crawford and Mrs. Chess Tapp, from this society were held.

We were indeed sorry to learn of the serious illness of Jerry Moore and wish for him a speedy recovery.

The last quarterly meeting for this year will be held at Cassidy church Sunday night, May 9 at 7:30. Rev. Warner P. Davis will be the speaker. Rev. J. M. Bevins, pastor.

The Garden

By John S. Gardner
University Of Kentucky

In general, two kinds of beetles attack beans. One comes very early, but stays only until favorite weeds are ready. When the weather stays cool and the beans grow slowly, the roundish holes they make may appear to be more serious than they really are. However, if only for the sake of the gardener's morale, the damage should be stopped by spraying or dusting with Methoxychlor or Rotenone, topside of the leaves, as the holes are eaten through. One application is usually enough.

The other kind, the Mexican beetle, is a serious pest for several reasons. One is that all three generations stay on the beans until they are entirely consumed. Because they feed only on the undersides of the leaves, control materials must be applied there, the holes are not eaten through. One application is usually enough.

After spring weather has definitely come, the brownish, overwintered adult beetles may be seen ambling about on the leaves or sunning themselves. The damage this generation does is minor. But after seven to 10 days, egg clusters will be found on the undersides of leaves. During a period of 10 days, each female will lay approximately 1,000 eggs. In another 10 days hatching starts, each larva being capable of eating 50 times it weight per day.

A good control program is to start applying either Methoxychlor or Rotenone when the first adults come, following with a second application in 10 days, the latter for leaves that have been put out during the 10-day egg-laying period.

In 30 days after the first treatment, the larvae that escaped may have become the parents of a second generation, and the same procedure should be followed. If adult beetles are seen in 30 days again, the same program should be followed. But usually this generation is light, depending on how well the previous work was done. The key is starting when the FIRST beetles come. Indeed, if everyone did the early work well, the Mexican beetle would be a thing of the past.

The specific control materials are ¾ to 1 percent Rotenone dust or 5 percent Methoxychlor. A better plan would be to spray with 50 percent Methoxychlor, 2 tablespoons to a gallon of water. An underslung nozzle should be used to put the material where the larvae will get it. Neither of the above materials is poisonous to humans when used as described.

Weekly Recipe

Tender yet crisp meringues with ice cream and fresh or frozen strawberries make a dessert for the finest occasion. Mrs. Pearl Haak, food specialist at the University of Kentucky, tells some of the secrets that make this dish a success.

Meringue Shells

6 egg whites
1 t cream of tartar
2 c sifted sugar
2 t vinegar
1 t vanilla
1 pint ice cream
1 pint of strawberries

Add cream of tartar to egg whites and beat until soft peaks form. Add sugar gradually while beating rapidly. Add vinegar and vanilla and beat about 12 minutes longer until stiff peaks bend only slightly.

For each serving, pile two large rounded tablespoons of meringue in a high heap on 4 ½-inch circles of unglazed paper placed on baking sheets. With rounded side of spoon, make a hole in the top by pushing down quickly and lightly to round out a good-sized well. Dip the spoon in hot water to keep the egg white from clinging to it. Bake in a very slow oven, 250 degrees, for one hour. Turn off the heat and let meringues remain in the oven until it has cooled completely. Remove paper from shells, and fill with ice cream and berries just before serving. Makes 6 to 8 large shells. Meringue may also be baked in a greased and floured pie plate built up with aluminum foil, or in a rectangular dish.

Menu: Roast beef, corn pudding, creamed cabbage, green salad, biscuits, butter and meringues with ice cream and berries.

Water Level Up On Dewey Lake

A five-foot raise in the water level of Dewey Lake in eastern Kentucky should help the fishing there considerably, according to officials of the Department of Fish and Wildlife Resources and the Department of Conservation.

The raise, only recently brought about by the U. S. Crops of Engineers, which built and operates Dewey Dam, will be permanent and will make a 46-foot level at the dam.

It will take several weeks for improvement to be shown because of the raise but elimination of much shallow water will make it easier for game fish to survive before rough fish prefer shallow areas for spawning. The raise has also increased the area of the lake and will make more food available for the fish.

Fishing at the Lake is described as "generally good" in the latest fishing report made by the Department of Fish and Wildlife Resources. Crappie and Bass are being taken throughout the length of the impoundment.

The area includes the boat dock, which has been moved and improved, and picnic areas already built by the Engineers. Ward said the state will concentrate on improving the fishing, picnicking and swimming facilities and building roads to make them more accessible, for the present.

A park adequate for the day use of persons living in the lake area is the first aim, with a full park development scheduled later, according to Ward.

Dewey Lake is a reservoir about 17 miles long and is located in Floyd County. It was formed when the dam was constructed on Johns Creek as a flood control and water conservation project in 1946.

Last year's tobacco yields in Monroe county were the highest ever produced there, despite the shortage of rainfall.

The Pikeville Junior Chamber of Commerce is encouraging gardens, chickens and other home-food production.

Franklin county farmers sowed an unusually large acreage of alfalfa, due in part to the failure of lespedeza last year.

FULTZ HARDWARE

WAKES UP LAZY MOTORS!

Sluggish motors perk up when you give them a shot of Ashland Ethyl with ICA.

ICA is a patented Ignition Control Additive. ICA prevents pre-ignition and spark plug fouling—keeps engines purring smoothly. You'll notice a powerful difference in from one to three tanks full of Ashland Ethyl with ICA.

HOW ICA REDUCES SPARK PLUG FOULING

Stop-and-go city driving forms deposits on spark plugs. When these deposits heat up at high speeds, the current that should fire the plug leaks away and the plug misfires. ICA converts the deposits into *non-conductors* of electricity and the spark plugs deliver full fire power.

HOW ICA CONTROLS PRE-IGNITION

With ordinary gasolines, combustion chamber deposits become red-hot and ignite the fuel before the spark plug fires. This causes loss of power, rough engine performance and knock. ICA treats combustion chamber deposits to prevent pre-ignition of the gasoline.

LABORATORY-TESTED—PROVED ON THE ROAD

After years of research, ICA was selected as the best of more than 200 compounds tested. Over 2,000,000 miles of grueling road tests proved ICA works best in actual use.

Suggests Caution In Setting Ky 35 Near Corn, Spuds

The following comments on growing Ky 35 burley tobacco near corn or potatoes are made by John W. Irvin, field agent for the University of Kentucky College of Agriculture and Home Economics:

"Ky 35 will be injured under certain conditions if a heavy concentration of corn pollen is allowed to blow on the tobacco. The practice of leaving a strip about 50 feet wide between corn and Ky 35 will prevent the concentration of pollen on the tobacco to the extent that usually no injury will occur.

"Some fields set adjacent to corn, especially when the corn was on the windward side of the tobacco, suffered from the burning effect of heavy pollen concentration on the crop.

"The veinbanding virus from potatoes may affect Ky 35 to the extent that it is observable, both in the field as leaf spots and in the cured tobacco. Ky 35 grown near potatoes, especially if peach aphids invade the two crops, may have a high percentage affected by the veinbanding virus. No recommendation as to distance between potatoes and Ky 35 tobacco can be made, as aphids drift long distances in the wind."

Ky 35 burley tobacco is being grown in large areas in an effort to reduce the nicotine content of Kentucky tobacco.

Farmers In Boyle Seed More Fescue

A survey shows that Ky 31 fescue is receiving major interest among farmers in Boyle county. "This grass," said UK County Agent John C. Brown, "not only came through last summer's drought but produced winter pasture and so helped farmers to stretch their limited hay supplies."

Dealers estimated that at least 50,000 pounds of fesue seed were sown in Boyle county, much of it with orchard grass seed. A. R. Herndon, Richard Caldwell and J. L. Helm, all winners in Green Pastures programs, were among the large number of Boyle county farmers who seeded grass-fescue mixtures on fertilized land. More than 200 farmers fertilized pastures.

Brown noted that many farmers are planning to sow sudan grass for emergency pasture and for silage.

Eggs Cheap; Save Them By Freezing

Now that eggs are lower in price, save them by freezing, say food specialists at the UK College of Agriculture and Home Economics. As long as they are fresh, eggs for freezing may be large or small, slightly cracked, or have abnormal shells. Dirty eggs should be washed before they are broken for freezing.

As each egg is broken, and inspected as to quality, the yolk and white may be separated for freezing, or whole eggs may be stirred to make a uniform mixture. Yolks frozen alone should be stirred and ½ teaspoon of salt added to each cupful. Whites should be neither stirred nor salted.

Waxed cardboard cartons or metal containers used for freezing other foods may be used, or even the trays for freezing ice cubes. Such trays, however, should be lined with Cellophane. The frozen eggs may then be forced from the dividers and stored in the freezer.

For further information on freezing foods, ask your country or home agent for Circular 398, Storing Foods in Freezer Lockers, or write to the Experiment Station, Lexington.

One Spray For All Kinds Of Insects

Home gardeners and home fruit growers no longer need to study complicated spray programs. Materials that control most insect pests now come mixed in oil package, and all are put on together instead of one at a time. They may be used in water as sprays or may be dusted on.

The principal ingredients of these all-purpose sprays or dusts are methoxychlor, malathion and captan. Experimental work conducted by the Entomology Department of the Kentucky Agricultural Experiment Station during the past two years showed that control of the common leaf-chewing and sucking insects, as well as mites, resulted from this combination.

Instructions on the control of insect pests have been published by the University of Kentucky and now are in the hands of county agents. See them for printed suggestions or write to the College of Agriculture, Lexington.

Farmers in Bath county will grow 50 acres or more of bush beans to supplement their incomes.

Agent To Improve Breathitt Tobacco

The tobacco program which UK County Agent J. W. Poe, Jr., put before farmers in Breathitt county included the following planks:

1. Grow either Ky 35 or 41A.
2. Cut down on the amount of nitrogen used.
3. Practice shallow tillage, and only to control weeds, not just to plow tobacco a certain number of times.
4. Top when in three-fourths bloom, and then let two top suckers grow, so as to produce a thinner and lighter tobacco.
5. Cut tobacco when it is ripe.

Farmers in Spencer county sowed 3,000 or more acres of alfalfa this spring.
