FLOUR, MEAL, FEED ETC.
Leading Brands ...
CRYSTAL AND PURITY.

TELEGRAMS BY AIR.

The Wireless System Is Now In Actual Operation.

Experiments Have Been Successful and the Absolute Secrecy Is Now Said Guaranteed.

The experiments have been completed by Lieutenant, and now anyone who chooses may send a message from London to England, can use the wireless telegraph system in actual operation at the experimental station established there by Prof. Marconi.

The principle of sending telegraphic messages without the use of wires is based upon the theory that the disturbance in the ether produced by the sparks of an induction coil. If we place a couple of tuning forks which are tuned to exactly the same pitch, a short distance from one another, and then cause the one to vibrate by striking one of them, some of the energy will be sound waves, which is conveyed through the air, and will cause the second tuning fork will to vibrate in unison. Experiments have been made to show that this principle will give evidence of the existence of vibrations through the medium of the ether. Within certain limits, and with certain differences, the same principle is the way in which electric waves are sent out from the transmitting station, and being received on another station, set that vibrations and thereby telegraphic signals.

This was a method of sending telegraphic messages without the use of wires, by Prof. Schiller, of New York City, by Prof. Oliver Lodge, in England, by Prof. Ducretet, in France, by Prof. Slaby, in Germany, and by Prof. Marconi, in England and Lieutenant Jameson-Davis, in Italy.

But Marconi, however, claims to have made improvements in the electrical transmission of messages that will make it impossible for any one to intercept a message that is being sent, except the officials of the company, and the person to whom the message is sent. Marconi claims that the methods which have been employed by others, which have been used with the wireless telegraph system, which would detect completely and would have the effect of destroying the secrecy of the message.

Marconi has established a station at Poldhu, on the Lizard, Cornwall, England, and a second station on the Island of Wight, a distance from the first station of 186 miles.

Lieutenant Jameson-Davis has established a station at Rome, Italy, and a second station on the Island of Sardinia, a distance of 200 miles.

Both of these stations are now in actual operation, and messages are sent and clearly interpreted from one to the other. The next step will be to establish a station at Gibraltar, and another at Malta, and then messages can be sent and clearly interpreted from one station to the other. The next step will be to establish a station at Gibraltar, and another at Malta, and then messages can be sent and clearly interpreted from one station to the other. The next step will be to establish a station at Gibraltar, and another at Malta, and then messages can be sent and clearly interpreted from one station to the other.

SHE WAS FASTIDIOUS.

A Suburban Woman Who Has Her Choice Every Hour Has a Way to the Door.

It might be reported naturally that the woman who has a choice of three places every hour in the day is somewhat fastidious. But the woman who has a choice of three places every hour in the day is somewhat fastidious. But the woman who has a choice of three places every hour in the day is somewhat fastidious. But
