Autumn "Nip"

Continued from Page 3

on the creature will usually cause its death, it often results in a severe fever through the process of reabsorption.

"When the brown recluse is found, immediate control measures should be taken," advises Dr. Schoelber, "in order to act promptly against the spider to reproduce, and increase the probability of eradication," according to the U.S. expert.

Household sprays containing 0.5 percent chlordane, 5 percent DDT, 1 percent DDT, 1 percent DDT, 1 percent lindane, or 2 to 3 percent malathion, are effective for exterminating the arachnid. One should use a residual spray with one or two applications of malathion or DDT, chlordane, or lindane, and the DDT or lindane should be applied to the base of the spider's cell, and the spider of cell, and the spider of cell, and the spider of cell.

One gallon of spray solution covers about 100 square feet of surface.

Schoelber cautions the individual against the practice of handling a brown recluse spider.

The crazy hunter will often feign death as a means of eluding the pursuer. Antagonized by the spray mixture and feeling that it is at hand, the creature becomes a dangerous adversary. Handling the spider is necessary, after spraying, and before disaster.

Deaths

MR. J. P. HADSON, 62, of 1115 N. 1st St., Carlisle, died at 10 a.m. Thursday, Nov. 25, at the Nicholas County Hospital, after a two-week illness. He was a native of Nicholas County and a member of the Blue Link Christian Church.

Survivors are two sons, Thomas Harris, Carlisle; Paul Harris, Lexington; one sister, Mrs. Susie Tompkins, Carlisle; one grandchild.

Funeral services were conducted at 10 a.m. Saturday at the Mathew-Shelley Chapel, by the Rev. James J. McCann, burial in the Carlisle Cemetery.

Pallorestre, Jimmy Dan Anderson, Carl Letcher, Billy Harris, Earl and Stanley Hamn and Roy Wagner.

CLYDE SWENNING, 59, died at 10:15, Thursday, Nov. 25, 1965, at the Nicholas County Hospital after a four-month illness. He was a native of Nicholas County and a member of Carlisle Methodist Church.

He is survived by his wife, Fannie Ruth Swenning; a daughter, Fannie Ruth Swenning; a sister Mrs. Clay Scott; Nicholas County, a granddaughter, Mrs. Paula Buckner, Carlisle; and one grandchild, Robert, Mrs. J. P. Hadson.

Funeral services were conducted at 2 p.m. Saturday at the Mathew-Shelley Chapel by Rev. James Norcross, pastor, by Rev. Dallas Suggs, burial in the Carlisle Cemetery.

Survivors: Noddy King, Carl Scott, Paul Spout, Ott Conrad, Geo Duncan and M.J. Riddell.

Autumn "Nip" Can Bring Recluse Spider's Bite

LEXINGTON, Ky. — Fall weather and cooler temperatures herald the annual migration from sunny lawns to warm fireplaces.

Many unsuspecting homeowners are unaware that an uninvited "guest," perhaps a spider, has already reappeared a quiet abode in some area of your property.

Your alert visitor—the often deadly brown recluse spider.

While no fatal bite has been reported in Kentucky, the reclusive creature can deliver a lethal injection of venom more potent than the feared black widow spider.

During the summer months it can reappear on curbs and drifts of earth, on the bark of a tree, or the left of a foot mill, but with the advent of fall the adventurous spider searches for winter quarters, usually the home where it favors an area of serenity and subdued light.

Although the recluse is often found in basements or cellars, it may likely appear on curbs and drifts of earth, on the bark of a tree, or the left of a foot mill, but with the advent of fall the adventurous spider searches for winter quarters, usually the home where it favors an area of serenity and subdued light.

Several medical records indicate the spider might take refuge in a book hiding beneath sheets or flannels. This presents an extremely dangerous situation. While the recluse is not known to attack readily, it often bites without hesitation when a sleeper turns over to bed and unsuspectingly presses his body against the creature.

The wary spider is capable of surviving temperatures ranging from 40 degrees F. to 112 degrees F. and has a life expectancy of almost two years—an unusual longevity for a spider. Female of the species can reproduce 150 young in 30 days.

The spider first came to attention in 1892 when A. Schoelber, zoologist and curator of the University of Kentucky College of Science, Lexington, discovered a specimen was sent to his laboratory from Carlisle, Ky. The following year another recluse was received for examination from Carlisle. Subsequent correspondence from the public reported the cases will before 1965, an spider has been in Kentucky for some time. Hundreds of spiders appear to be found in the Commonwealth, but only a few are not only harmless but also attractive.

Since they feed on insects and other invertebrate pests, Dr. Schoelber attributes the undesired presence of the recluse in Kentucky to some "accident" by the public—meaning its medium size and ordinary appearance deceive the casual observer. The recluse is unlike its cousin the black widow spider, and the unwary might view the arthropod with a mixture of annoyance and repugnance, but scarcely fear.

Dr. Schoelber describes the brown recluse as shy and withdrawn. Adults average about 4/10-inch long, but they range in various sizes from 3/10- to 1/2-inch, legs excluded. Usually they are brown in color but they may also be light tan or cream. Because of many hairs on their body, they appear to have the texture of suede. The section of the body that bears the legs is lighter in color than the abdomen, and has a dark, fiddle-shaped design on it. Because of this pattern, the spider is sometimes called the "fiddle spider," although the "fiddle" is often difficult to distinguish in some specimens.

The creature resembles several species of common house spiders and is often called the "brown recluse spider," a comparatively harmless predator that some scientists consider an excellent "pet." The confusion in identity of the recluse spiders has restricted its recognition. The spider, however, is capable of biting and its venom is extremely poisonous in some sensitive people. Rights of the recluse remain uncertain, but scientists agree that its reclusive habit is probably Mexican in origin.

It was not until the 1950's, as a result of bites in several western states, that the brown recluse was recognized by medical authorities as extremely poisonous. U. S. Public Health Service officials have "tracked" the spider's migration to the southern and central United States.

The brown recluse appears quite unattractive in the creature's laboratory. It is puzzled with reports of the spider's appearance in some regions of the United States, but apparent absence in some sections of the same area.

The spider appears partial to the southern district of Kentucky. Although a few physicians in eastern Kentucky have treated little wounds attributable to the recluse, research scientists have been unsuccessful in their attempts to locate a specimen.

The Lexington region is not considered a desirable environment for
